

Figure 14: single-column layout check

A4 preview at 85 mm column width. Not the publisher's typeset proof.

New single-column version

Previous version at the same width

Fig. 14. Resource landscape for SOC and SOH models. The panels compare exported parameter count, idealized parameter storage, flash occupancy of the available firmware builds, and recorded static-plus-peak-stack RAM. Parameter counts include weights and merged biases in the C exports. The storage estimate assumes four bytes per parameter for Base and Pruned and one byte for Quantized. The all-INT8 estimate is idealized because the implemented quantized model retains FP32 parameters and additionally stores row scales. Dark bars denote SOC, light bars denote SOH. Memory is expressed in KiB.
